## About HAECHI AUDIT

HAECHI AUDIT is a global leading smart contract security audit and development firm operated by HAECHI LABS. HAECHI AUDIT consists of professionals with years of experience in blockchain R&D and provides the most reliable smart contract security audit and development services.

So far, based on the HAECHI AUDIT's security audit report, our clients have been successfully listed on the global cryptocurrency exchanges such as Huobi, Upbit, OKEX, and others.

Our notable portfolios include SK Telecom, Ground X by Kakao, and Carry Protocol while HAECHI AUDIT has conducted security audits for the world's top projects and enterprises.

Trusted by the industry leaders, we have been incubated by Samsung Electronics and awarded the Ethereum Foundation Grants and Ethereum Community Fund.

## 01. Introduction

This report was written to provide a security audit for the StackerVC smart contract. HAECHI AUDIT conducted the audit focusing on whether StackerVC smart contract is designed and implemented in accordance with publicly released information and whether it has any security vulnerabilities.

The issues found are classified as **CRITICAL**, **MAJOR**, **MINOR** or **TIPS** according to their severity.

### **CRITICAL**

Critical issues are security vulnerabilities that **MUST** be addressed in order to prevent widespread and massive damage.

### **MAJOR**

Major issues contain security vulnerabilities or have faulty implementation issues and need to be fixed.

### **MINOR**

Minor issues are some potential risks that require some degree of modification.

### **TIPS**

Tips could help improve the code's usability and efficiency

HAECHI AUDIT advises addressing all the issues found in this report.

## 02. Summary

The code used for the audit can be found at GitHub

- [https://github.com/jack0x-tech/StackerVC\\_VentureFund001/tree/fund-2](https://github.com/jack0x-tech/StackerVC_VentureFund001/tree/fund-2)
  - Commit Hash : b0192cf354537c1b6a7dc3257066c086624e60fb

### Update

[v2.0] - new commit(d6cd3ea1b4257e742e3abd48aa6f6df3800fa11f) has fixed 1 Critical, 1 Minor issues and applied 2 TIPS.

### Issues

HAECHI AUDIT has 1 Critical Issues, 0 Major Issues, and 1 Minor Issue; also, we included 3 Tips that would improve the usability and/or efficiency of the code.

Severity	Issue	Status
<b>CRITICAL</b>	1inch swap() function will enable transfer	(Found - v1.0) (Resolved - v2.0)
<b>MINOR</b>	does not check if internal transaction succeeded	(Found - v1.0) (Resolved - v2.0)
<b>TIPS</b>	Wrong error message prefix	(Found - v1.0) (Resolved - v2.0)
<b>TIPS</b>	use type(uint256).max instead of declaring constant variables	(Found - v1.0) (Resolved - v2.0)
<b>TIPS</b>	use contract.function.selector instead of declaring constant variables	(Found - v1.0)
<b>Notice</b>	governance can transfer the underlying asset of FarmTreasuryV1	(Found - v1.0)

## 03. Overview

### Contracts Subject to Audit

- FarmBossV1.sol
- FarmBossV1\_TEST.sol
- FarmBossV1\_USDC.sol
- FarmBossV1\_WBTC.sol
- FarmBossV1\_WETH.sol
- FarmTokenV1.sol
- FarmTreasuryV1.sol
- FarmTreasuryV1\_ETH.sol

## Notice

- **governance can transfer the underlying asset of FarmTreasuryV1**

FarmTreasuryV1 contract has a rescue() function to withdraw tokens owned by the contract. Although this function won't make any trouble in most cases, if governance withdraws the underlying asset of the contract, it will result in losses to depositors.

## 04. Issues Found

**CRITICAL : 1inch swap() function will enable transfer (Found - v.1.0)**  
**(Resolved - v2.0)**

**CRITICAL**

### Problem Statement

FarmBoss contracts limit functions that can be called by farmers. To be safe from farmers withdrawing assets, `_checkContractAndFn()` does not allow transfer/approve function's signature. However, all FarmBoss contract whitelists 1inch exchange's swap function and approved the maximum amount to 1inch exchange. Since swap function supports sending swap destination token to `non-msg.sender` address using `SwapDescription.dstReceiver`, it will open the vulnerability that enables farmers transferring the asset.

### Recommendation

Do not allow swap functions to be called by farmers.

### Update

The StackerVC team has fixed the issue by removing 1inch functionality.

**MINOR : does not check if internal transaction succeeded (Found - v1.0)**  
**(Resolved - v2.0)**

**MINOR**

### Problem Statement

`FarmBoss#govExecute/farmerExecute` function calls `_executes` function but does not check if the contract call was successful. This may not open any vulnerabilities but it may result in confusing results.

### Recommendation

revert when `_execute()` function returns false on first return value.

## Update

The StackerVC team has confirmed that they know of this issue and this is intended behavior.

## **TIPS : Wrong error message prefix (Found - v1.0) (Fixed - v2.0)**

### **TIPS**

FarmBoss#rescue() function has require message prefixed with "FARMTREASURY"

## **TIPS : use type(uint256).max instead of declaring constant variables (Found - v.1.0) (Fixed - v2.0)**

### **TIPS**

Instead of declaring MAX\_UINT256 constant variable, use type(uint256).max<sup>1</sup> which is supported in solidity natively.

## **TIPS : use contract.function.selector instead of declaring constant variables (Found - v.1.0)**

### **TIPS**

Instead of declaring a function selectors as a bytes4 variable, use contract.function.selector<sup>2</sup> to increase clarity and to avoid stack too deep error.

## 05. Disclaimer

This report is not an advice on investment, nor does it guarantee adequacy of a business model and/or a bug-free code. This report should be used only to discuss known technical problems. The code may include problems on Ethereum that are not included in this report. It will be necessary to resolve addressed issues and conduct thorough tests to ensure the safety of the smart contract.
